## Abstract

Intersection  
theorems  
are  
used  
to  
prove  
the  
existence  
of  
solutions  
to  
mathematical  
programming  
and  
game  
theoretic  
problems.  
The  
known  
intersection  
theorems  
on  
the  
unit  
simplex  
are  
the  
theorems  
of  
Knaster-Kuratowski-Mazurkiewicz  
(KKM)  
,  
Scarf,

Shapley,  
Freund,  
and  
Ichiishi.  
Recently  
the  
intersection  
result  
of  
KKM  
has  
been  
generalized  
by  
Ichiishi  
and  
Idzik  
to  
closed  
coverings  
of a  
compact  
convex  
polyhedron,  
called a  
polytope.  
In  
this  
paper  
we  
formulate a  
general  
intersection  
theorem  
on  
the  
polytope.  
To  
do  
so,  
we  
need  
to  
generalize  
the  
concept  
of  
balancedness  
as  
is  
used  
by  
Shapley  
and  
by  
Ichiishi.  
The  
theorem  
implies  
most  
of  
the  
results  
stated  
above  
as  
special  
cases.

First,  
we  
show  
that  
the  
theorems  
of  
KKM,  
Scarf,  
Shapley,  
Freund,  
and  
Ichiishi  
on  
the  
unit  
simplex  
and  
also  
some  
theorems  
of  
Ichiishi  
and  
Idzik  
on a  
polytope  
all  
satisfy  
the  
conditions  
of  
our  
theorem  
on  
the  
polytope.  
Secondly,  
the  
general  
theorem  
allows  
us  
to  
formulate  
the  
analogs  
of  
these  
theorems  
on  
the  
polytope.

Key  
words:  
intersection  
theorem,  
unit  
simplex,  
polytope,  
closed  
covering,  
balancedness

□

## Introduction

Intersection  
theorems

are

used

to

prove

the

existence

of

solutions

to

mathematical

programming

problems

and

game

theoretic

problems.

The

probably

most

well-known

intersection

theorem

is

the

Knaster-Kuratowski-Mazurkiewicz

(KKM)

Lemma

on

the

unit

simplex.

This

lemma

(see

Knaster,

Kuratowski

and

Mazurkiewicz

[13]

)

states

that  $n$

closed

subsets

covering

the

$(n-1)$ -dimensional

unit

simplex

$S_n$

and

satisfying

some

boundary

condition

have a

nonempty

intersection. A

related

theorem

is

due

to  
Sperner  
[20]  
and  
is  
reformulated  
by  
Alexandroff  
and  
Pasynkoff  
[1]  
(see  
also  
[2,  
4,  
11,  
18])  
.  
Further  
generalizations  
of  
intersection  
theorems  
on  
the  
unit  
simplex  
can  
be  
found  
in  
Scarf  
[17]  
,  
Shapley  
[19]  
,  
Todd  
[22]  
,  
Freund  
[5]  
,  
Ichiishi  
[8]  
and  
Joosten  
and  
Talman  
[12]  
.  
Moreover,  
generalizations  
of  
intersection  
theorems  
to  
the  
cube  
or  
simplotope  
are  
stated  
in  
Freund  
[5]  
,  
van

der  
Laan,  
Talman  
and  
Van  
der  
Heyden  
[15]

,  
van  
der  
Laan  
and  
Talman  
[16]

,  
and  
Talman  
[21]

.  
These  
generalizations  
can  
be  
used  
to  
prove  
the  
existence  
of a  
Nash  
equilibrium  
in a  
noncooperative  
N-person  
game.

In  
the  
nineties  
the  
intersection  
theory  
has  
been  
generalized  
by  
Ichiishi  
and  
Idzik

[10]  
to  
closed  
coverings  
of a  
compact,  
convex  
polyhedron,  
called a  
polytope.  
In  
this  
paper  
we  
formulate a  
general  
intersection

theorem  
on  
the  
polytope.  
The  
theorem  
differs  
from  
the  
results  
mentioned  
above  
by  
the  
way  
in  
which  
the  
boundary  
conditions  
are  
formulated.  
In  
all  
these  
intersection  
theorems  
the  
boundary  
condition  
is  
of  
the  
form  
that  
every  
face  
of  
the  
set  
under  
consideration  
(simplex,  
simplex,  
or  
polytope)  
is  
covered  
by  
the  
union  
of  
some  
specified  
elements  
of  
the  
family  
of  
sets  
forming  
the  
covering.  
In  
our  
theorem  
we  
give a

sufficient  
general  
condition  
to  
be  
satisfied  
at  
every  
point  
on  
the  
boundary.  
Our  
result  
implies  
most  
of  
the  
results  
stated  
above  
as  
special  
cases.  
In  
particular  
we  
show  
that  
the  
theorems  
of  
KKM,  
Alexandroff  
and  
Pasynkoff  
(AP  
in  
short)  
,  
Scarf,  
Shapley,  
Freund,  
and  
Ichiishi  
on  
the  
unit  
simplex  
and  
also  
some  
theorems  
of  
Ichiishi  
and  
Idzik  
on a  
polytope  
can  
be  
derived  
from  
our  
theorem  
as  
special  
cases.

To  
our  
knowledge,  
there  
is  
no  
result  
which  
has  
unified  
both  
the  
KKM  
lemma  
and  
the  
intersection  
lemma  
of  
Alexandroff  
and  
Pasynkoff.  
Our  
theorem  
also  
allows  
to  
extend  
some  
theorems  
on  
the  
unit  
simplex  
to  
the  
polytope.  
In  
particular,  
we  
formulate  
the  
analog  
of  
the  
theorems  
of  
KKM,  
AP,  
Shapley,  
Freund,  
and  
Ichiishi  
on  
the  
polytope.  
One  
of  
these  
results  
is  
closely  
related  
to a  
result  
given  
in  
Ichiishi

and  
Idzik  
[10]

.  
This  
paper  
is  
organized  
as  
follows.  
Section 2  
contains  
the  
mathematical  
preliminaries.  
Several  
concepts  
and  
some  
notation  
are  
introduced  
concerning  
the  
polytope.  
Also  
the  
concept  
of  
balancedness  
of a  
collection  
of  
vectors  
is  
given.  
In  
Section 3  
we  
formulate  
and  
prove  
the  
main  
result.  
In  
Section 4  
we  
show  
that  
most  
of  
the  
results  
on  
the  
unit  
simplex  
follow  
as  
special  
cases  
from  
our  
main  
theorem.  
In  
Section 5

we  
derive  
some  
special  
theorems  
on  
the  
polytope.

3

□

2

Preliminaries

For a  
convex  
set  $B$  .  
 $\mathbb{R}^n$  ,  
let  
 $\text{bnd}(B)$  and  
 $\text{int}(B)$   
denote  
the  
(relative)  
boundary  
and  
the  
(relative)  
interior  
of  
 $B$ ,  
respectively.  
For  
any  
positive  
integer  
 $n$ ,  
the  
set  
of  
integers  
 $\{1, \dots, n\}$   
is  
denoted  
by  
 $I_n$  .  
Consider  
an  
arbitrary  
 $n$ -dimensional  
polytope  $P$   
given  
by

. . .

$P =$   
 $x.$   
 $\mathbb{R}^n \mid a$   
 $i$   
 $.$   
 $x = a$   
 $i,$   
 $i.$   
 $I,$

where

$a_i$  .  
 $I R^n$   
 and  $a_i$  .  
 $I R$ ,  
 $i$ .  
 $I$ , and  $I$   
 is a  
 finite  
 set  
 of  
 at  
 least  
 $n + 1$   
 elements.  
 Throughout  
 the  
 paper  
 we  
 assume  
 that  
 none  
 of  
 the  
 constraints  
 defining  $P$   
 is  
 redundant.  
 For  $T$  .  
 $I$ , we  
 define  
 $\square$   
 .  
 $i \dots$   
 $F(T)$   
 $=$   
 $x \cdot P \mid$   
 $ax =$   
 $a_i$   
 for  
 $i$ .  
 $T$ .  
 Observe  
 that  
 $F(T)$   
 $, T$  .  
 $I$ , may  
 be  
 empty.  
 When  
 $F(T)$   
 is  
 not  
 empty  
 we  
 call  
 $F(T)$  a face  
 of  
 $P$ .  
 When,  
 for  
 some  $i$  .  
 $I, T =$   
 $\{i\}$ , we call  
 $F(T)$  a facet of  $P$

and  
we  
denote  
this  
facet  
by  
 $F_i$   
.Observe  
that  
 $F(\emptyset)$   
=  
 $P$ .

For  
 $x$ .  
 $\text{bnd}(P)$   
,  
the  
set  $I_x$   
is  
defined  
as

$\square$   
.

$i..$

$I_x =$   
 $i. I \mid$   
 $ax = a_i,$

i.e.  $I_x$   
is  
the  
set  
of  
indices  
for  
which  
the  
corresponding  
constraint  
is  
binding  
at  
 $x$ .  
Clearly,  
for  
any  $T \subseteq I$   
 $x, x$   
belongs  
to  
 $F(T)$   
.

Furthermore,  
for  
nonempty  $T \subseteq I$ , let  
 $A(T)$  be the  
cone  
defined  
by  
 $\square$   
.

$A(T)$   
=

$x \in \mathbb{R}^n$  |  
 $x = \sum_{i=1}^n a_i$   
 $i, a_i = 0$ ,  
 for  
 $i \in T$   
  
 $i \in T$   
  
 and  
 define  
 $A(\emptyset)$   
 $=$   
 $\{0\}$   
 .  
 Moreover,  
 for  
 any  $T \subseteq \mathbb{R}^n$  .  
 I, let  
 $A^*(T)$  be the  
 polar  
 cone of  
 $A(T)$   
 defined  
 by  
 $\square$   
 .  
  
 $\square$  .  
  
 $A(T)$   
 $= \{y \in \mathbb{R}^n \mid$   
 $y \cdot x = 0$   
 for  
 all  
 $x \in A(T)\}$  .  
  
 By  
 definition  
 we  
 have  
 that  
 $A(T) \cap A^*(T) =$   
 $\{0\}$ , for  
 any  $T \subseteq \mathbb{R}^n$  .  
 I.  
 Finally,  
 for  
 some  
 finite  
 set  
 $J$ ,  
 let a  
 collection  
 of  
 vectors  
 $c_j, j \in J$  .  
 $J$ , in  $\mathbb{R}^n$ ,  
 be  
 given.  
 For a  
 nonempty

```

set T .
J,we
define
..
[]
.
..

j

C(T)
=
.
x.
IRn |
x=
μj
cj
μj
=
1
and
μj =
0, j .
T.
,

j.Tj.
T

i.e.
C(T)
is
the
convex
hull
of
the
vectors
cj , j .
T.
Definition
2.1

For
some
nonempty
subset T
of
J,
the
collection
of
vectors
{cj | j .
T}
is
balanced
when
the
origin
lies
in
the
relative
interior
of
C(T)

```

i.e.  
if  
the  
system  
of  
linear  
equations

.  
\*

j.  
T  
 $\mu_j$   
 $c_j$   
=  
0  
has a  
positive  
solution  
 $\mu_j$ ,  $j \in T$ .

Without  
confusion,  
we  
say  
that  
the  
set  $T$   
is  
balanced  
if  
the  
corresponding  
collection  
of  
vectors  
is  
balanced.

4

□  
3  
Intersection  
theorem

In  
this  
section  
we  
present  
our  
main  
result.  
To  
prove  
the  
main  
result,  
we  
first  
recall  
the  
following

lemma  
 which  
 can  
 be  
 seen  
 as a  
 version  
 of  
 Ky  
 Fan's  
 coincidence  
 theorem.  
 This  
 theorem  
 has  
 been  
 used  
 to  
 prove  
 various  
 intersection  
 theorems  
 (see  
 Ichishi  
 [7]  
 and  
 Ichiishi  
 and  
 Idzik  
 [10])  
 .  
 For  
 the  
 proof  
 of  
 this  
 lemma  
 we  
 refer  
 to  
 Fan  
 [1972,  
 Theorem  
 5,  
 p.108])  
 .

Lemma  
 3.1  
 Let  $D$   
 be a  
 nonempty,  
 compact,  
 convex  
 subset  
 of  
 $\mathbb{R}^n$ . Let  $\varphi$   
 and  $F$   
 be  
 two  
 upper  
 semi-continuous  
 point-to-set  
 mappings  
 from  $D$   
 to  
 $\mathbb{R}^n$   
 such

that  
 for  
 any  $x \in D$   
 both  
 $f(x)$   
 and  
 $F(x)$   
 are  
 nonempty,  
 compact,  
 convex  
 subsets  
 of  
 $\mathbb{R}^n$ .  
 Suppose  
 that  
 for  
 each  $x \in D$   
  
 ....  
  
 and  
 each  $c \in \mathbb{R}^n$   
 satisfying  
 $c^T x = \max\{c^T y \mid y \in D\}$   
 ,  
 there  
 exist  $v \in f(x)$   
 and  $w \in F(x)$   
 ....\*\*  
  
 such  
 that  
 $c^T v = c^T w$ .  
 Then  
 there  
 is  
 at  
 least  
 one  
 point  $x \in D$   
 such  
 that  
 $f(x) \cap F(x) \neq \emptyset$   
  
 =  
 $\emptyset$   
 .  
  
 For a  
 given  
 polytope  $P$   
 and a  
 collection  
 of  
 vectors  
 $\{c_j\}$ .

$I \cap J \neq \emptyset$ .  
 $J$   
 for a  
 finite  
 set  
 $J$ ,  
 suppose we have a  
 collection  
 of  
 sets  
 $\{C_j \mid j \in J\}$   
 $J$   
 being a  
 closed  
 covering  
 of  
 the  
 polytope  $P$ .  
 Given  
 this  
 collection,  
 for  
 any  $x \in P$   
 ,we  
 define  $J(x) =$   
 $\{$   
 $j \in J \mid x \in$   
 $C_j$   
 $\}$

.  
 In  
 the  
 next  
 theorem  
 we  
 give a  
 sufficient  
 condition  
 to  
 guarantee  
 that  
 there  
 is a  
 balanced  
 set  
 of  
 indices  
 in  $J$   
 such  
 that  
 the  
 intersection  
 of  
 the  
 sets  
 labelled  
 by  
 these  
 indices  
 is  
 nonempty.

Main  
 Theorem

For a  
 finite  
 set

```

J, let
{Cj | j ∈ J}
be a
collection
of
vectors
and
let
{Cj | j ∈ J}
be a
collection
of
closed
sets
covering
the
full-dimensional
polytope P =
{
x ∈ ℝ^n |
a_i · x = a_i,
i ∈ I}
,
such
that
for
every x ∈ P
it
holds
that
C(x) = ∅
.
Then
there
exists a
balanced
set T ⊆ J
for
which n
j ∈ T
.

* *
Cj =
∅
.

Proof.
Define
the
two
point-to-set
mappings F
and G

```

from  $P$   
to  
 $\mathbb{R}^n$   
by

$\cdot(x)$   
=  
 $\{0\}$   
,  
 $F(x)$   
=  
 $C(\cdot)$   
 $x)$   
.

It  
is  
clear  
that  $F$   
and  $\cdot$   
have  
nonempty,  
convex  
and  
compact  
values  
and  
are  
upper  
semi

....

continuous.

For  $x \in P$   
 $\text{bnd}(P)$   
,  
take  $c \in \mathbb{R}^n$   
such  
that  
 $c \in \max\{cy \mid y \in P\}$   
}

.  
Then  $c \in A(\cdot)$   
 $I(x)$   
.

By  
the  
boundary  
condition,  
there  
exists  $z \in C(\cdot)$   
 $x) \cap A^*(I(x))$   
.

$\cdot$   
 $i.e.$   
there

exists

....

z .  
 $F(x)$   
 for  
 which  
 $cz =$   
 $0 =$   
 $cy$   
 with  $y$   
 $=$   
 $0 .$   
 $.(x)$   
 $.$   
 For  $x .$   
 $\text{int}(\text{$   
 $p$   
 $)$   
 $,$   
 we  
 have  
 that

....

$cx$   
 $= \max\{cy \mid y . P\}$   
 if  
 and  
 only  
 if  $c$   
 $=$   
 $0$   
 and  
 hence  
 it  
 follows  
 again  
 that  
 for  
 all

....

z .  
 $F(x)$  we have that  
 $cz =$   
 $0 =$   
 $cy$   
 with  $y$   
 $=$   
 $0 .$   
 $.(x)$   
 $.$   
 Thus  
 all  
 conditions  
 of  
 Lemma

\*

3.1  
 are  
 satisfied  
 and

there  
exists a  
point  $x \in P$   
such  
that  
 $\cdot ($   
 $x$   
 $*$   
 $) \cap$   
 $F($   
 $x$   
 $*$   
 $)$   
 $\square$   
 $= \emptyset$   
and  
hence  
 $*$   
 $*$

\*\*

$0 \in$   
 $C($   
 $J \times$   
 $)$   
 $\cdot$   
Choosing a  
subset  $T$   
of  $J \times$   
such  
that  $0 \in$   
 $\text{int}(C($

$\square$   
In  
the  
next  
section  
the  
Main  
Theorem  
will  
be  
applied  
to

obtain  
several  
intersection  
results  
on  
the  
(n-  
1)-dimensional  
unit  
simplex  
in  
the  
n-dimensional  
Euclidean  
space.  
To  
do  
so,  
we  
have  
to  
modify  
the  
main  
theorem  
for  
allowing  
to  
apply  
the  
theorem  
on  
lower  
dimensional  
polytopes.  
So,  
for  $1 \leq l < n$ ,  
let  
us  
consider  
the  
l-dimensional  
polytope  
 $P_l$  in  
 $\mathbb{R}^n$   
given  
by

$\{$

$\cdot$

$i$

$\cdot$

$h..$

$P=$

$x.$

$\mathbb{R}^n \mid$

$ax = a$

$i,$

$i.$

$I$  and

$dx = d$

$h, h. I$

$n-$

$l,$

$h$   
 where  
 $d.$   
 $IR^n$   
 and  $d \cdot h$  .  
 $IR,$   
 $h. I$   
 $n-$   
 $1$   
 and  
 $I$  is a  
 finite  
 set  
 of  
 at  
 least  
 $1+$   
 $1$   
 elements.  
 Again  
 we  
 assume  
 that  
 none  
 of  
 the  
 constraints  
 defining  
 $P$  is  
 redundant.  
 To  
 adapt  
 the  
 main  
 theorem,  
 let  
 $n-1$   
 .  
 $V=$   
 $\{x.$   
 $IR^n \mid$   
 $x= . h$   
 $dh, .h .$   
 $IR$   
 for  
 $h. I$   
 $n-1\}$   
 $h=$   
 $1$   
 and  
 $*..$   
 $V=$   
 $\{x.$   
 $IR^n \mid$   
 $xy=0, \text{ for}$   
 all  
 $y.$   
 $V\}$   
 as  
 the

subspace  
 orthogonal  
 to  
 $V$ .  
 Furthermore,  
 for  
 nonempty  
 $T$ .  
 $I$ , let  
 $A(T)$  be the  
 cone  
 defined  
 by  
 $\{$   
 $\cdot \cdot$   
 $A(T)$   
 $=$   
 $V +$   
 $X$ .  
 $IR^n \mid$   
 $x = \sum_i a_i$   
 $i, a_i =$   
 $0$ ,  
 for  
 $i \in T$   
 $i$ .  
 $T$   
 $*$   
 and  
 define  
 $A(\emptyset)$   
 $=$   
 $V$ . Moreover,  
 for  
 any  
 $T$ .  
 $I$ , let  
 $A(T)$   
 be  
 again  
 the  
 polar  
 cone  
 of  
 $A(T)$ .  
 The  
 proof  
 of  
 the  
 next  
 corollary  
 goes  
 analogously  
 to  
 the  
 proof  
 of  
 the  
 main  
 theorem  
 by  
 using

....

thefact  
that  
for  
thecasethat  
 $x$ .  
 $\text{int}(P)$   
wehavethatthe

j

The
AP
lemma
is a
special
case
of a
theorem
of
Scarf
[17]
which
is
implied
by
Corollary
3.2.

```

To  
state  
Scarf's  
theorem,  
let  $B$   
be  
an  $n$   
 $\times k$   
matrix,  
 $k > n$ ,  
satisfying  
that

$i$

$b_i =$   
 $e_i$ ,  
In,  
with  
 $b_j$   
the  
 $j$ th  
column  
of  
 $B$ ,  $j$   
. $i, k$  .

Theorem  
4.3  
Scarf  
Lemma.

$n$

Let  
 $\{C_j$   
 $\}$   
 $j$   
 $\cdot$   
 $i$   
 $k\}$  be a  
collection  
of  
closed  
sets  
covering  
the  
unit  
simplex  
satisfying  
that

$n$

for  
every  $h$

$\cdot$   
 $i$   $n$   
the  
facet  
 $S$  is a  
subset  
of  
 $Ch$ . Let  $c$   
. $i, R^n$   
 $\setminus \{0\}$   
be  
given

and  
assume

$h +$

that  
the  
set  
of  
solutions  
{  
y  
.IRk  
|By =  
c} is  
nonempty  
and  
bounded.  
Then  
there  
exists

+  
 $\square$   
\*

aset T  
.  
I k  
such  
that  
the  
system  
of  
equations  
j.  
T  
 $\mu_j$   
 $b_j = c$   
has a  
positive  
solution  
and

\*

\*

n  
j.  
T  
Cj  
 $\square$   
=  
 $\emptyset$   
.

Proof.  
Take  $j = I k$   
and  
for j  
.  
I  
k, take  
 $c_j =$   
 $b_j$   
-  
. j

$c$ , where  $j =$   
 $n \cdot b_j$   
 . So  $j$   
 $=$   
 $1$   
 for  
 $j$   
 $\cdot$   
 $i \cdot n \cdot$   
 without  
 loss  
 of  
 generality  
 we  
 may  
 assume  
 that  $c$   
 $\cdot S_n \cdot$   
 Then  
 $m \cdot c_j$   
 $= 0, j$   
 $\cdot$   
 $i$   
 $k,$   
 $*$   
 $n$   
 and  
 hence  
 $C(j)$   
 $\cdot$   
 $V \cdot$   
 Let  $x$   
 $\cdot \text{bnd}(S)$  and  $T =$   
 $I_X \cdot$   
 From  
 the  
 boundary  
 condition  
 we  
 have  
 that  
 $C($   
 $T )$   
 $\cdot C($   
 $j$   
 $x)$   
 and  
 hence  
 the  
 boundary  
 condition  
 of  
 Corollary  
 3.2  
 is  
 satisfied  
 if  
 $A^*($   
 $T$   
 $)n C($   
 $T )$   
 $\square$   
 $=$   
 $\emptyset$   
 $\cdot$   
 First

```

suppose
that  $c_h$ 
=
0
for
all  $h$ 
.
T.
Then,
for
every
 $i$ ,
 $j$ 
.
T,
it
holds
that
 $c_j \dots a_i$ 
=  $(e_j$ 
-  $c) \dots (m - e_i)$ 
=
-  $e_j \dots e_i$ 
= 0,
so
that
 $c_j$ 
.  $A^*($ 
T
)  $nC($ 
T
) for
any  $j$ 
.
T
. Now

.  $c_j$ 
 $c_j$ 
suppose
that  $c_h >$ 
0 for
some  $h$ 
.
T.
Then
take  $y =$ 
 $j$ .
T.
Clearly,  $y$ 
.  $C($

KKM  
lemma  
is a  
special  
case  
of  
the  
intersection  
theorem  
of  
Shapley  
[19]

$\cdot$   
To  
formulate  
Shapley's  
lemma,  
we  
need  
the  
concept  
of  
balancedness  
of  
sets.  
To  
distinguish  
the  
balancedness  
of  
sets  
from  
the  
notion

of  
balancedness  
of  
vectors  
in  
Definition  
2.1,  
we  
speak  
in  
the  
former  
case  
about  
set-balancedness.

Definition  
4.5

Let  $N$   
be  
the  
collection  
of  
all  
nonempty  
subsets  
of  
the  
set  
of  
integers  $I_n$ .  
Then a  
family

\*

$B =$   
 $\{$   
 $B$   
 $1, \dots, B_k\}$  of  
 $k$   
 $\square$   
elements  
of  $N$   
is  
set-balanced  
if  
there  
exist  
positive  
numbers  
 $\cdot j$ ,

$k$   
\*

$j$   
 $= 1, \dots, k,$   
such  
that  
 $\cdot m B_j =$   
 $m.$

$j =$   
 $1 \dots j$

Theorem

#### 4.6 Shapley Lemma.

 $I \in$   
 $\setminus$   
 $T$   
 $C$  for  
 every  $T \in I \in$ .  
 Then  
 there  
 is a  
 set-balanced  
 family  $B =$   
 $\{B_j \mid$   
 $\emptyset$

$\{$   
 $B$   
 $\dots, B\}$  of  
 elements  
 of  $N$   
 for  
 which  
 $n_C \leq$   
 $\cdot$

$1_k$

$j =$   
 $1$

$S_S$

Proof.  
 For  
 any  
 set  $S$   
 $\in N$ ,  $S$   
 $= \emptyset$   
 $I$   
 $n$ , take  
 $C =$   
 $m - m$ .  
 Then

$C(J)$   
 $\cdot V^*$ . From  
the

boundary  
condition  
we  
have  
that  $J \times$   
contains  
some  
set  $S$

$\cdot$   
 $I \cap$   
 $\setminus T$ , where  $T = I \times$   
 $\cdot$ . More-  
 $S \cdot$

over,  
for  
any  $T$

$\cdot$   
 $I$   
 $n$ ,  
 $c_{aj}$   
 $= 0$  for  
every  $j$

$\cdot$   
 $T$   
and  $S$

$\cdot$   
 $I \cap$   
 $\setminus T$ .  
Hence,  
for  
any  $x$   
on  
the

$n$   
 $*$

boundary  
of  
 $S_w$   
have  
that  
 $C($   
 $J)$   
 $n_A($   
 $I$   
 $x)$   
 $\square$

$\cdot$   
From  
Corollary  
3.2  
it  
follows  
that  
there

$x =$   
 $\emptyset$   
exists a  
family  
 $B =$   
 $\{B, \dots, B_k\}$  satisfying

that  
the  
collection  
of  
vectors  
 $c_j, j$   
 $=1, \dots, k,$

1

$k_j$   
S

is  
balanced  
and  
 $n_C = \emptyset$

.  
By  
definition  
of  
the  
vectors  
 $c, S$   
.N,  
the

 $-e_j$ ,  
 $i, j$   
.  
 $I \cap$  .  
Theorem  
4.8  
Joosten  
and  
Talman  
Lemma.

Let  
 $\{C_{ij} \mid i \in I$   
 $n, j \in I$   
 $n\}$   
be a  
collection  
of  
closed  
sets  
covering  
the  
unit  
simplex  
 $S_n$   
satisfying  
that  
if  $x$   
 $\in \text{bnd}(S_n)$   
,  
then  $x$   
 $\in C_{ij}$   
for  
some  $j$   
.  
 $I \cap$   
with  $x_j > 0$   
or  $x$   
.  
.  
 $j$ .  
 $I$   
 $C_{ij}$

$n$   
 $*$   
 for  
 all  $i \in I$   
 for  
 which  $x_i$   
 $= 0$ .  
 Then  
 there  
 exists a  
 nonempty  
 set  
 $I \subseteq I$   
 and,  
 with  
 is  
  
 $k =$   
 $|I^*|$   
 $,$  a  
 permutation  
 $s(I^*) = ($   
 $s$   
 $1, \dots, s_k)$   
 of  
 the  
 elements  
 of  
 $I^*$   
 $,$   
 such  
 that  $n$   
 $i \in$   
 $I$   
 $C \cap$ .  
  
 $* i =$

 We  
 mention  
 that  
 the  
 intersection  
 theorems  
 of  
 AP,  
 KKM,  
 Shapley,  
 Freund,  
 and  
 Ichiishi  
 have  
 been  
 generalized  
 to  
 the  
 product  
 space  
 of  $N$   
 unit  
 simplices  
 (see  
 [5,  
 14,  
 15,

16,  
21])

.  
We  
notice  
that  
also  
these  
generalizations  
can  
be  
derived  
from  
Corollary  
3.2.

5  
Intersection  
theorems  
on  
the  
polytope

In  
this  
section  
the  
Main  
Theorem  
is  
applied  
to  
generalize  
several  
of  
the  
intersection  
theo

i..

rems  
on  
the  
unit  
simplex  
to  
an  
arbitrary  
full  
dimensional  
polytope  $P =$   
{  
 $x$   
 $\in \mathbb{R}^n \mid x = a$   
 $i,$   
 $i \in$   
 $I\}$

.  
First  
we  
generalize  
the  
AP  
Lemma  
to  
the  
polytope.

To  
prove  
this  
generalization,  
we  
state  
the  
following  
lemma,  
in  
which  
for  $T$  .

$$\begin{aligned} &I, \\ &\tilde{A}(T) \\ &= \\ &\{ \\ &x \mid x \\ &IR^n \mid x \\ &= \end{aligned}$$

□□

i

$$\begin{aligned} &. i \\ &a, . i \\ &=1, . i \\ &=0, \\ &i.T\} \\ &. \end{aligned}$$

$$\begin{aligned} &i.Ti. \\ &T \end{aligned}$$

Lemma  
5.1  
For  
any  $T$   
. $I$ ,  
 $\tilde{A}(T)$   
 $n-A^*(T)$   
□  
=  
∅  
.

Proof.  
If  $0$  .  
 $\tilde{A}(T)$   
,  
then  
the  
lemma  
holds  
because  $0$  .  
 $A^*(T)$   
.

Now,  
suppose  
that  $0$   
□. $\tilde{A}(T)$   
.

Since  
 $\tilde{A}(T)$   
. $A(T)$  and  
 $A(T)$   
 $nA^*(T)$   
=

{0}, it  
follows  
that  
 $\tilde{A}(T)$   
 $nA^*(T)$   
=  
 $\emptyset$   
.

..  
i  
\*\*

Hence,  
for  
every  
 $x.A^*(T)$   
,  
 $x_a >$   
0  
for  
at  
least  
one  
i.T.  
Therefore,  
 $a >$   
0  
with  
the  
optimal  
value  
of  
the  
primal  
linear  
programming  
problem

..

(P)  
min  
a,  
s.t.  
 $x.A^*(T)$  and  
 $a = x_a$   
i,  
for  
all  
i.T.  
\*

Now,  
let  
.be  
the  
optimal  
value  
of  
the  
dual  
linear  
programming  
problem

..

(D)  
max  
',  
s.t.  
-  
y  
.A~(T)and .  
=-ya  
i,for  
all  
i.T.  
\*  
\*  
\*

Then  
according  
to  
the  
primal-dual  
theory  
we  
have  
that  
.=  
a>0.  
Let y  
be  
any  
solution

\*.  
i \*  
\*\*\*

to  
(D)  
.  
Then,  
-ya=.>  
0for  
all i  
.  
T  
and  
hence y  
.A(T)  
.  
Since  
-  
y  
.A~(T)  
,  
9

□  
this  
proves  
the  
lemma. .

Lemma  
5.1  
is  
used  
to

prove  
the  
following  
generalization  
of  
the  
AP  
lemma  
to  
an  
arbitrary  
polytope  $P$ .

Theorem  
5.2

Let a  
polytope  $P$   
be  
given  
and  
let  
 $\{C_j$   
 $\mid$   
 $j$   
 $\in I\}$  be a  
collection  
of  
closed  
sets  
covering  $P$

h

and  
satisfying  
that  
for  
every  $h$

$\cdot$   
 $I$   
the  
facet  $F_h$   
is a  
subset  
of  
 $C_{\cdot}$ .  
Then  
there  
exists a  
set

\*

\*

$T$

$\cdot$

$I$

such

that

$\{a_j$

$\mid$

$j$

$\cdot$

$T$

$\cdot\}$  is

balanced

and  
 $n_j$ .  
 $T$   
 $C_j$   
 $\square$   
 $=$   
 $\emptyset$   
 $.$

Proof.  
 Take  $J = I$   
 and  
 $ch =$   
 $-ah$ ,  $h$   
 $.I$ .  
 For a  
 boundary  
 point  $x$   
 in  
 the  
 relative  
 interior

$h$

of  $F$   
 $($   
 $T$   
 $)$

,  
 we  
 have  
 that  
 $-A^{\sim}($   
 $T)$   
 $.C($   
 $J$   
 $x)$   
 since  $x$   
 $.C$  for  
 every  $h$

$.$   
 $T$ .  
 From  
 Lemma  
 5.1  
 it  
 follows  
 that  
 there  
 exists a  $y$   
 $.-A^{\sim}($   
 $T)$   
 satisfying  $y$   
 $.A^*($   
 $T$   
 $)$

$.$   
 So,  $y$   
 $.C($   
 $J$   
 $x)$   
 $nA^*($   
 $I$   
 $x)$

,  
 since  
 $-A^{\sim}($

$T_j$   
 $\cdot C_j$   
 $x_j$  and  $\sum x_j = T$ .  
 Hence  
 the  
 boundary  
 condition  
 of  
 the  
 Main  
 Theorem  
 is

\*  
 \*

\*

satisfied  
 and  
 there  
 exists a  
 balanced  
 set  $T$

$\cdot$   
 $\sum_{j \in T} I_j$   
 for  
 which  $\sum_{j \in T} n_j$   
 $\cdot$   
 $\sum_{j \in T} C_j$

$\square$   
 $=$   
 $\emptyset$

$\cdot$   
 Clearly,  
 if  $T$   
 is

\*

balanced,  
 then  
 also  
 $\{a_j$   
 $|$   
 $j \in T\}$   
 $\cdot$   
 $\sum_{j \in T} I_j$   
 $\cdot$   
 $\sum_{j \in T} C_j$  is  
 balanced.

\*

Theorem  
 5.2  
 says  
 that  
 under  
 the  
 boundary  
 condition  
 there  
 exists a  
 set  
 of  
 indices  $T$

such

h  
\*

that  
the  
intersection  
of  
the  
sets  
C, h

·  
T ,  
is  
not  
empty  
and 0  
lies  
in  
the  
interior  
of

\*

the  
convex  
hull  
of  
the  
vectors  
ah , h

·  
T .  
The  
theorem  
is  
illustrated  
in  
Figure 1  
for

\*  
\*

n  
=  
2  
and I = I  
5.In  
this  
figure x  
is  
the  
unique  
intersection  
point.  
At x  
it  
holds  
that

\*

124  
x  
·CnCnwhereas 0  
lies

in  
 the  
 relative  
 interior  
 of  
 the  
 convex  
 hull  
 of  
 $a_1$  ,  
 $a_2$  ,  
 $a_4$   
 and  
 hence  
 the  
 set  
 $\{1, 2, 4\}$  is  
 balanced.  
 Notice  
 that  
 the  
 points  
 $x_1$   
 and  
 $x_2$   
 do  
 not  
 satisfy  
 the  
 requirements  
 because  
 at  
 $x_1$   
 we  
 have  
 that  $0$   
 is  
 not  
 in  
 the  
 convex  
 hull  
 of  
 $a_2$  ,  
 $a_3$  ,  
 $a_4$   
 and  
 at  
 $x_2$   
 we  
 have  
 that  $0$   
 is  
 not  
 in  
 the  
 convex  
 hull  
 of  
 $a_1$  ,  
 $a_4$  ,  
 $a_5$  .

In  
 Theorem  
 5.2

it  
is  
assumed  
that  
for  
every  $h$   
.  
I  
the  
facet  $F_h$   
lies  
in  
Ch. The  
next  
corollary  
follows  
immediately  
from  
Theorem  
5.2  
by  
taking  
the  
sets  
covering  $P$   
equal  
to  
 $C_j$   
 $F_j$ ,  $j$   
.  
I.

Corollary  
5.3  
Let  
 $\{C_j$   
 $\mid$   
 $j \in I\}$  be  
an  
arbitrary  
collection  
of  
closed  
sets  
covering  
the  
polytope  $P$ .  
Then  
there  
exist a  
set  $T^*$

.  
I  
and  
an  $x^*$   
.  
 $P$ ,  
such  
that  
 $\{a_j$   
 $\mid$   
 $j \in I$   
.  
 $T^*$   
 $\}^*$  is

\*  
\*

\*

balanced  
and  
for  
every  $j$

$\dot{T}, x$   
 $\square.C_j$   
implies  $x$   
 $\dot{F}_j$  .

In  
Corollary  
5.3  
we  
allow  
that  
some  
of  
the  
sets  
 $C_j$   
are  
empty.  
In  
particular,  
suppose  
that  $k$   
\*

$P$   
is  
covered  
by  
just  
one  
set  
 $C$  for  
some  $k$   
.I. Now,  
let  $x$   
be a  
solution  
to  
the  
linear  
programming  
problem

$\dot{k}i..$

min  
 $x_a$   
subject

 ,  
 we  
 have  
 that  
 according  
 to  
 Theorem  
 5.2  
 the  
 polytope  
 is  
 covered  
 by  
 $n+1$   
 closed  
 sets.  
 $n+1$   
 Since  
 for  
 any  $k =$   
 $n,$   
 $0$   
 can  
 not  
 lie  
 in  
 the  
 relative

interior  
of  
the  
convex  
hull  
of  
any  $k$   
of  
the  
 $a_j$   
's,  
we must have that  
 $T^* = I$   
and  
hence  
by  
the  
Main  
Theorem  
the  
 $n+1$   
sets

$n+1$

have a  
nonempty  
intersection.  
This  
result  
is  
equivalent  
to  
the  
AP  
lemma  
on  
the  
(unit)

\*

simplex,  
see  
Theorem  
4.1.  
In  
general,  
if  
in  
Theorem  
5.2  
the  
set  
 $T$  contains  
more  
than  
 $n+1$   
elements,  
then  
the  
set  
 $T^*$   
can  
be

reduced  
 to a  
 set  
 $T$   
 of  
 $n+1$   
 indices,  
 such  
 that  
 the  
 vectors  
 $a_j, j \in T$   
 ,  
 are  
 affinely  
 independent.  
 Notice  
 that  
 we  
 do  
 not  
 require  
 that  
 in  
 Theorem  
 5.2  
 the  
 set  
 $T^*$   
 must  
 exist  
 of  
 precisely  
 $n+1$   
 elements.  
 For  
 example,  
 let  
 the  
 polytope  
 be  
 given  
 $n$   
 by  
 the  
 $n$ -dimensional  
 unit  
 cube  
 $K$  defined  
 by  
 $n$   
 $K =$   
 $\{x \in \mathbb{R}^n$   
 $|$   
 $0$   
 $=$   
 $x_i$   
 $= 1 \text{ for } i \in I$   
 $I$   
 $n\}$   
 .

$n$   
 $n$   
 Let  
 $u$   
 denote  
 the  
 $2^n$  facets  
 of  
 $K_{\mathbb{F}}$   
 $+$   
 $i =$   
 $\{x \in K \mid$   
 $x_i = 1\}$  and  $F$   
 $-$   
 $i =$   
 $\{x \in K \mid$   
 $x_i = 0\}$   
 $+$   
 for  $i$   
 $= 1, \dots, n$ .  
 In  
 this  
 case  $I = I_n$   
 $-$   
 $I_n$   
 and  
 the  
 polytope  
 is  
 covered  
 by  
 $2^n$   
 closed  
 sets,  
 $+$   
 $i$   
 $-ih$   
 denoted  
 by  
 $C$  and  
 $C$  for  
 $i = 1, \dots, n$ ,  
 such  
 that  
 $C$  contains  $F_h$   
 for  
 every  
 $h$ .  
 $I_n$   
 $-$   
 $I_n$ .  
 Under  
 this  
 boundary  
 condition  
 we  
 have  
 the  
 following  
 corollary  
 which  
 is

similar  
to a  
result

11

□  
stated  
in  
[5]  
.

Corollary  
5.4  
Let  $P$   
be  
the  
 $n$ -dimensional  
unit  
cube  
 $K_n$   
and  
let  
 $\{Ch$   
 $|$   
 $h$   
 $\cdot$   
 $I_n$   
 $\cdot$   
 $I_n$

=  
 $\emptyset$

Theorem  
 5.2  
 can  
 be  
 seen  
 as  
 the  
 continuous  
 analog  
 of  
 Theorem 2  
 of  
 Freund  
 [6]

,  
 where  
 it  
 is  
 shown  
 that  
 in a  
 labelled  
 simplicial  
 subdivision  
 of  
 the  
 polytope  $P$   
 with  
 label  
 set  
 $I$ , there

$h$

exists a  
 set  $T$   
 of  
 labels,  
 such  
 that  $0$   
 lies  
 in  
 the  
 convex  
 hull  
 of  
 the  
 set  
 $\{a, h$   
 $.T\}$  and  
 there  
 is a  
 simplex  $s$   
 such  
 that  
 the  
 set  $T$   
 is  
 the  
 set  
 of  
 labels  
 of  
 the  
 vertices

of  
 s.  
 This  
 theorem  
 of  
 Freund  
 contains  
 as a  
 special  
 case a  
 result  
 of  
 van  
 der  
 Laan  
 and  
 Talman  
 [14]  
 ,  
 implying  
 that  
 in  
 any  
 properly  
 labelled  
 simplicial  
 subdivision  
 of  
 an  
 n-dimensional  
 cube  
 $K_n$   
 with  
 label  
 set  $I_n$   
 ,  
 $I_n$   
 $n$ ,  
 there  
 exist  
 an  
 integer  $h$   
 ,  
 $I_n$   
 and a  
 simplex  $s$   
 having  
 two  
 vertices  
 with  
 labels  $h$   
 and  
 $-h$ .  
 This  
 result  
 is  
 the  
 combinatorial  
 analog  
 of  
 Corollary  
 5.4.  
 The  
 next  
 result  
 on  
 the  
 cube

is  
due  
to  
Freund  
[5]  
.

Theorem  
5.5  
Freund  
Theorem  
on  
the  
Cube

Let  $P$   
be  
the  
 $n$ -dimensional  
unit  
cube  
 $K_n$   
and  
let  
 $\{Ch$   
 $|$   
 $h$   
 $\cdot$   
 $I_n$   
 $\cdot -$   
 $I$   
 $n\}$   
be a  
collection  
of  
closed  
sets  
covering  
 $K_n$   
such  
that  
for  
every  $T$   
 $\cdot$   
 $I_n$   
 $\cdot -$   
 $I$   
 $n$ ,  
with  $T$   
 $n\{j,$   
 $-$   
 $j$   
 $\} \cap$   
 $=$   
 $\emptyset$  for  
any  $j$   
 $\cdot$   
 $I$   
 $n$ ,  
it  
holds  
that  
 $\{$   
 $x$   
 $\cdot K_n$   
 $|$   
 $x_j$   
 $= 0,$

$j$   
 $\in T$ ,  
 $x_j$   
 $= 1$ ,  
 $-$   
 $j$   
 $\in T\} \dots k$ .  
 $T$   
 $C_k$  .  
Then  
there  
is  
  
 $+i$   
  
an  
index  $i$   
  
 $I_n$   
such  
that  
 $C_n C_i$   
 $i$   
 $= \emptyset$   
.

Proof.  
We  
have  
that  
 $a_+$   
 $j =$   
 $e_j$   
and  
 $a_-$   
 $j =$   
 $-e_j$   
for  
every  $j$   
.

$I_n$   
. Set  $J = I_n$   
. -  
 $I_n$   
and  
 $c_j =$   
 $-a_j$   
for  $j$   
. J.

Suppose  
that  $x$   
is  
an  
arbitrary  
interior  
point  
of a  
proper  
face  
 $F(T)$  of  
 $K_n$  .  
Then  
we  
have  
that  
  
 $F(T)$   
=

```

{
  z
  .Kn
  |
  z_j
  =0,
  j
  □, S,
  z_j
  =1,
  -
  j
  □.
  S }

with S = J
\{-
i | i . T
}
.
Observe
that
if i .
T,
then
-
i
□
. T
and
that
|T|
=
n.

*

Notice
that I x = T . S
and J x .
S.
It
is
easy
to
check
that
C(S) .
A(
I
x)
.
So
the

.
*boundary
condition
of
the
Main
Theorem
is
satisfied.
But
for
any
T. I n

```

.-  
I  
n, the  
h

system  
h.  
 $T \cdot h$   
 $a = 0$   
can  
only  
have a  
positive  
solution  
if  
for  
some  $i$   
.  
I n  
both  
+  
i  
and  
-i

\*

\*

belong  
to  
 $T \cdot \cdot$

In  
the  
next  
theorem  
we  
generalize  
the  
KKM  
lemma  
on  
the  
unit  
simplex  
to  
the

nn

polytope  
P.  
To  
do  
so,  
we  
first  
observe  
that  
the  
face  
 $S(T)$   
of  
the  
unit  
simplex

Sis  
just

in\T

the  
convex  
hull  
of  
the  
vertices  
 $e, i$   
 $\square.T.$   
Hence  
 $S(T)$   
can  
be  
written  
as  
.I n  
with  
.S  
i

defined  
as  
the  
convex  
hull  
of  
the  
vertices  
 $e, i$  .  
S.  
Doing  
so,  
the  
boundary  
condition  
of  
the  
KKM  
lemma  
can  
be  
rewritten  
as  
.S  
.  
.  
j.  
S  
Cj  
for  
any  $S \in I$   
n.This  
gives  
an

12

$\square$   
important  
insight  
in  
the  
difference

between  
the  
AP  
lemma  
and  
the  
KKM  
lemma.  
In  
the

nh  
h

AP  
lemma,  
each  
facet  
Sh  
is  
covered  
by  
Cand  
so  
the  
number  
of  
sets  
Cis  
equal  
to  
the  
number  
of  
facets.  
In  
generalizing  
the  
AP  
lemma  
to  
the  
polytope,  
we  
indeed  
had  
that  
in  
Theorem  
5.2  
the  
number  
of  
sets  
covering  
the  
polytope  
equals  
the  
number  
of  
constraints.  
However,  
in  
the  
KKM  
lemma  
we

have  
 that  
 each  
 face,  
 being  
 the  
 convex  
 hull  
 of a  
 number  
 of  
 vertices,  
 is  
 covered  
 by  
 the  
 union  
 of  
 sets  
 corresponding  
 to  
 the  
 vertices  
 carrying  
 the  
 face.  
 So,  
 the  
 number  
 of  
 sets  
 equals  
 the  
 number  
 of  
 vertices.  
 For  
 $n=2$   
 or  
 $|I| = n+1$   
 the  
 number  
 of  
 vertices  
 equals  
 the  
 number  
 of  
 facets.  
 However,  
 for  
 $n \geq 2$  and  
 $|I| > n+1$ ,  
 this  
 is  
 in  
 general  
 not  
 the  
 case.  
 So,  
 generalizing  
 the  
 KKM

lemma  
 to  
 the  
 polytope,  
 the  
 number  
 of  
 sets  
 covering  $P$   
 should  
 be  
 equal  
 to  
 the  
 number  
 of  
 vertices.  
 Therefore,  
 for a  
 given  
 polytope  $P =$   
 $\{x \in \mathbb{R}^n \mid$   
 $a_i \cdot x = a_i,$   
 $i \in I\},$  let  
 $t$  be  
 the  
 number  
 of  
 vertices  
 and  
 let  
 $\{v_j \mid j \in I\}$   
 be  
 the  
 set  
 of  
 vertices  
 of  
 $P$ .  
 Then  
 we  
 have  
 the  
 following  
 generalization  
 of  
 the  
 KKM  
 lemma,  
 in  
 which  
 the  
 boundary  
 condition  
 says  
 that  
 every  
 face  
 is  
 covered  
 by  
 the  
 sets

labelled  
by  
the  
vertices  
of  
that  
face.  
The  
proof  
follows  
again  
straightforward  
from  
the  
Main  
Theorem  
by  
taking  
 $J = I \setminus t$   
and  
 $c_j =$   
 $c_{-}$   
 $v_j$  ,  
 $j \in$   
 $J$ .  
We  
remark  
that  
this  
result  
can  
also  
be  
derived  
from  
the  
combinatorial  
result  
given  
in  
Theorem 4  
of  
Freund  
[6].

Theorem  
5.6

Let  
 $\{C_j \mid j \in I \setminus t\}$   
be a  
collection  
of  
closed  
sets  
covering  
the  
polytope  $P$   
with  
vertices  
 $v_j$  ,

hh

$j \in I \setminus t$ ,

satisfying  
that  
every  
face  
 $F(T)$

,  
 $T$ .  
 $I$ ,  
is  
covered  
by  
 $\{C|$   
 $v.$   
 $F(T)\}$

.  
Then  
for  
any  
 $c. P$   
there  
exists a  
set  
 $T^* . I t$   
such  
that  
clies  
in  
the  
convex  
hull  
of  
the  
vectors  
 $v_j ,$   
 $j.$   
 $T$ , and  $n$   
 $j.$   
 $T$   
 $\square$

\*  
\*  
 $C_j =$   
 $\emptyset$   
.

Theorem  
5.6  
holds  
for  
any  
 $c.$   
 $P. If 0 .$   
 $P$ , we  
may  
take  
 $c=$   
 $0$   
and  
obtain  
the  
result

\*

that  
there  
is a

set  
of  
indices  
Tfor  
which  
the  
corresponding  
sets  
Cj  
have a  
nonempty  
intersection  
and  
for  
which  
the  
collection  
of  
corresponding  
vertices  
is  
balanced.  
Theorem

5.6  
is  
illustrated  
in  
the  
Figure  
2.  
In  
this  
figure  
we  
have  
that  
the  
point  
clies  
in  
the  
convex  
135135

It  
should  
be  
noticed  
that  
Theorem

5.6  
is a  
special  
case  
of  
Theorem  
3.1  
in  
Ichiishi  
and  
Idzik  
[10]

.  
Ichiishi  
and  
Idzik  
also  
show  
that  
their  
Theorem  
3.1  
is a  
special  
case  
from  
the  
theorem  
below,  
stated  
as  
Theorem  
3.4  
in  
[10]

.  
Below  
we  
show  
that  
this  
latter  
theorem  
is a  
special  
case  
of  
our  
Corollary  
3.2.  
In  
the  
following,  
 $\text{aff}(S)$   
denotes  
the  
affine  
hull  
of  
the  
set  
 $S$ .

Theorem  
5.7  
Ichiishi  
and  
Idzik

Theorem.

For  
 $k > n$ , let  
 $B$  be  
an  
 $n \times k$  matrix  
with  
columns  
 $b_j$ ,  
 $j = 1, \dots, k$ , and  
for  
 $t = 1, \dots, n$ ,  
let  $w_t$   
be  
the  
convex  
hull  
of  
the  
vectors  
 $b_j$ ,  
 $j = 1, \dots, k$ .  
Let  
 $\{C_j \mid j = 1, \dots, k\}$   
be a  
collection  
of  
closed  
sets  
covering  
the  
set  
 $W$ . For  
some  
 $C$ ,  
 $w$ , assume that the  
set of solutions  
 $\{y \in \mathbb{R}^k \mid By = c\}$   
+  
is  
bounded.  
Furthermore,  
assume  
that  $0 \in \text{aff}(w)$ ,  
 $b_j \in \text{aff}(w \setminus \{0\})$   
for  
all  
 $j = 1, \dots, k$ , and

13

□  
Figure  
2:  
Illustration  
of  
Theorem  
5.6;  $n =$   
2,  $I = I_5$

that  
for  
every  
proper  
face  $F$   
of  $W$   
it  
holds  
that  $F$   
 $\in \{C_j$   
 $| b_j$   
 $\cdot aff$   
 $(F) + aff$   
 $\{0, c\}$   
 $, j$   
 $\cdot$   
 $I$   
 $k\}$ .

□

\*

Then  
there  
exists a  
set  
 $T$ .  
 $I_k$   
such  
that  
the  
system  
of  
equations  
 $j$ .  
 $T$   
 $\mu_j$   
 $b_j = c$   
has

=  
∅

Proof.  
 Since  $0$   
 $\cdot W$ ,  
 without  
 loss  
 of  
 generality  
 we  
 may  
 assume  
 that  
 aff  
 $(w)$   
 $=$   
 $\{$   
 $x$   
 $\cdot \mathbb{R}^n$   
 $|$   
 $\square$   
 $n$   
 $1$   
 $x_j$   
 $= 1\}$  and  
 hence  $1 = n$   
 $-1$  and  
 $d =$   
 $m,$   
 so  
 that  $V =$   
 $\{$   
 $x$   
 $\cdot$   
 $\square$   
 $\mathbb{R}^n$   
 $|$   
 $x =$   
 $\cdot m, \cdot$   
 $\cdot \mathbb{R}\}$   
 $\cdot$   
 $j =$   
 $1$   
 $n$   
  
 Now,  
 take  $J = I$   
 $k,$   
 and  
 for  $j$   
 $\cdot J,$  take  
 $c_j =$   
 $-b_j + \cdot j$   
 $c,$  where  $\cdot j =$   
 $i =$   
 $1$   
 $b_{ji} \cdot$   
 Since  $c$   
 $\cdot$   
 $w$   
 we  
  
 ....

have  
that  $0$   
.C(J)  
.  
Moreover,  
 $m_c$   
 $=1/$   
 $n$   
and  
hence  
for  
all  $j$   
.  
 $i \leq k$   
we  
have  
that  
 $m_{c,j}$   
 $=$   
 $0$   
\*  
and  
therefore  
 $c_j$   
.  
 $v$   
.So  
C(J)  
.  
 $v$   
\*.Now,  
let  $x$   
be a  
point  
in  
the  
interior  
of  
some  
face  $F$   
of  
 $W$ .  
Then,  $I \ni x$   
.  
 $I$   
is  
the  
set  
of  
elements  
corresponding  
to  
its  
binding  
constraints,  
i.e.  $F =$   
{  
 $x$   
.  
 $w \mid$   
 $a_i \leq$   
 $x = a$   
 $i, i$   
.  
 $I$

$x\}$   
 ,  
 with  
 the  
 appropriate  
 vectors  
 $a_i$   
 $\in \mathbb{R}^n$   
 and  
 numbers  $a_i$   
 $\in \mathbb{R}$ ,  
 $i$   
 $i = 1, \dots, n$ .  
 According  
 to  
 the  
 boundary  
 condition  
 there  
 exists  
 an  
 element  $h$   
 $\in \mathbb{R}$   
 $h > 0$   
 such  
 $h < h_0$   
 that  
 both  
 $h$   
 $\in C(\mathbb{R})$   
 $h$   
 $x$ ) and  
 $b =$   
 $d + d h$   
 $c$ , for  
 some  
 $d h$   
 $\in \text{aff}(F(\mathbb{R}))$   
 $x$ )  
 $)$   
 and  $d h$   
 $\in \mathbb{R}$ .  
 By  
 substi  
 $\square$   
 $h h$   
 $n h$   
 tuting  
 $b w e$   
 now  
 obtain  
 that  
 $c =$   
 $-d h$   
 $+(c h$   
 $-d h)c$ .  
 By  
 definition,  
 $c =$   
 $0$ ,  
 whereas

$j =$   
 $\sum_{j=1}^n$   
 $j$   
 $\square\square\square$   
 $h$   
 $nnn$   
 $both$   
 $dand\ c$   
 $are$   
 $in$   
 $w.Hence,\ 0 =$   
 $j =$   
 $\sum_{j=1}^n$   
 $ch_j =$   
 $j =$   
 $\sum_{j=1}^n$   
 $-dh_j$   
 $+($   
 $\cdot\ h$   
 $-$   
 $d$   
 $h)$   
 $j =$   
 $\sum_{j=1}^n c_j =$   
 $-1 + \cdot\ h$   
 $-$   
 $d\ h$   
 $and$   
 $so$   
 $ch =$   
 $c-dh.$  Moreover,  
 $ai$   
 $\cdot\ c$   
 $=$   
 $a\ i$   
 $for$   
 $all\ i$   
 $\cdot$   
 $I$   
 $and$   
 $ai..dh = a\ i$   
 $for$   
 $all\ i$   
 $\cdot$   
 $I$   
 $x.$  So,  
 $for$   
 $all$   
 $*$   
 $i$   
 $\cdot$   
 $I$   
 $x,$   
 $ai..ch =$   
 $ai..$   
 $c$   
 $-ai..dh$   
 $=0$  and  
 $thus$   
 $ch$   
 $\cdot A($   
 $I$   
 $x)$

Therefore,  
 $\chi$   
 $A^*($   
 $I$   
 $x)$   
 $nC($   
 $J$   
 $x)$  and  
 $*$

the  
 conditions  
 of  
 Corollary  
 3.2  
 are  
 satisfied.  
 Hence,  
 there  
 exists a  
 balanced  
 set  
 $T$ .  
 $I_k$   
 such

$*$   
 $*$   
 $*$

$*$

that  $n$   
 $j$ .  
 $T$   
 $C_j$   
 $\square$   
 $=$   
 $\emptyset$

Balancedness  
 of  
 $T$  implies  
 that  
 there  
 exist  
 $j >$   
 $0$  for  $j$   
 $T$  satisfying

$\square$

$\dots$

$*$   
 $c_j$   
 $= 0$ .  
 Hence,  
 $b_j =$   
 $a^* c$   
 with  
 $a^* =$   
 $*$

$\dots$   
 Since  
 the  
 set

of  
solutions

\*  
\* \*

$j.Tj$   
 $j.Tj$   
 $j.$   
 $T$   
 $jj$

□

\*\*

{  
y  
.IRk  
|By =  
c} is  
bounded,  
we  
must  
have  
that  
 $a >$   
0.  
Hence,  
 $\mu bj =$   
C,  
where

\*

+  
 $j.Tj$   
14

.

\*

$j$   
 $\mu =$   
 $>$   
0  
for  
every  $j$   
 $.T^* . .$

$ja^*$

Finally  
we  
consider  
the  
generalizations  
of  
the  
Shapley  
and  
the  
Ichiishi  
lemma

on  
the  
unit  
simplex  
to  
the  
polytope.  
The  
first  
case  
is a  
straightforward  
generalization  
of  
Theorem  
5.6  
by  
allowing  
that  
the  
polytope  $P$   
is  
covered  
by a  
collection  
of  
closed  
subsets

$\mathcal{S}$

$\{C|$   
 $S$   
 $.L\}$ , where  
 $L$  is  
the  
collection  
of  
nonempty  
subsets  
of  $I$ . It  
.For  $S$   
.L, let  
vbe

any  
point  
in  
the  
convex  
hull  
of  
vertices  
 $v_j, j$   
.S.  
Then  
we  
have  
the  
following  
result  
which  
 $\mathcal{S}$

follows  
from  
the  
Main

Theorem  
by  
taking  
 $C =$   
 $C - v$ ,  $S$   
 $L$ .

Theorem  
5.8

Sh

Let  
 $\{C\}$   
 $S$   
 $L$  be a  
collection  
of  
closed  
sets  
covering  
the  
polytope  $P$   
with  
vertices  
 $v$ ,

Sh

$h$ .  
 $I$   
 $t$ ,  
satisfying  
that  
every  
face  
 $F(T)$   
 $T$   
 $I$ ,  
 $I$ ,  
is  
covered  
by  
 $\{C \mid v \in F(T)\}$   
for  
all  
 $h$ .  
 $S$

Then,  
for  
any  $c$   
 $P$ ,  
there  
exists a  
family  
 $B =$   
 $\{$   
 $B$   
 $, \dots, B\}$  of  $k$   
elements  
of  
 $L$  such

$1 \leq k$   
 $C_j =$   
 $\emptyset$

that  $c$

lies  
in  
the  
convex  
hull  
of  
the  
vectors  
 $v_j$ ,  $j$   
 $=1, \dots, k$ , and  
 $n$   
 $B$   
 $\square$   
.

$j=$   
1

Theorem  
5.8  
is  
illustrated  
in  
Figure  
3.  
In  
this  
figure  
the  
point  $c$   
lies  
in  
the  
convex  
hull  
of

1223  
14512  
23  
145 \*

$v$ ,  
 $v$  and  
 $v$ ,  
whereas  
the  
sets  
 $C$ ,  
 $C$  and  
 $C$  meet  
each  
other  
in  
point  $x$  .  
Observe

1

that  
the  
point  
 $x$  does  
not  
satisfy  
for  
the  
point  $c$

chosen  
in  
the  
figure,  
but  
becomes  
an

1223  
2

intersection  
point  
as  
soon  
as  $c$   
is  
moved  
to a  
point  
in  
the  
convex  
hull  
of  
 $v$ ,  
vand  
 $v$ .  
To  
generalize  
the  
lemma  
of  
Ichiishi  
on  
the  
unit  
simplex  
to  
the  
polytope  
 $P$ , let  $M$

$T$

be  
the  
collection  
of  
subsets  $T$   
of  $I$   
for  
which  
 $F(T)$  is a  
face  
of  
 $P$ , and  
for  $T$   
 $M$ , let  
abe  
any  
point  
in  
 $A^-(T)$   
 $n-A^*(T)$

.  
From  
Lemma

5.1  
we  
know  
that  
the  
latter  
set  
is  
nonempty.

Th

Notice  
that  
 $a =$   
aif  $T =$   
 $\{h\}$ for  
some  
h.I.  
Then  
also  
the  
next  
result  
follows  
from  
the

SS

Main  
Theorem  
by  
taking  
 $C =$   
 $-a, S$   
 $.M.$

Theorem  
5.9

S

Let  
 $\{C\} \subseteq$   
 $.M\}$   
be a  
collection  
of  
closed  
sets  
covering  
the  
polytope  $P$   
satisfying  
that

S

every  
face  
 $F(T)$   
 $, T$   
 $.M,$   
is  
covered  
by  
 $\{C\} \cap T$ .

$S\}$   
 .  
 Then  
 there  
 exists a  
 balanced  
 $B_k$   
 $C_j =$   
 $\emptyset$   
  
 collection  
 of  
 vectors  
 $a_j, j$   
 $= 1, \dots, k,$   
 such  
 that  
 $n$   
 $B$   
 $\square$   
 .  
  
 $j =$   
 $1$   
  
 $SS$   
 $h$   
  
 observe  
 that  
 $a.A^{\sim}(S)$   
 and  
 hence  
 $a$  is  
 the  
 convex  
 combination  
 of  
 the  
 vectors  
 $a,$   
 $h.s.$   
 This  
 implies  
 that  
 the  
 theorem  
 can  
 be  
 reformulated  
 by  
 stating  
 that  
 there  
 exists a  
 collection  
 $B =$   
 $\{$   
 $B$   
 $1, \dots, B_k\}$  of  
 elements  
 of  
 $M$  such  
 that  
 $n_j k$   
 $=$   
 $1$   
 $CB_j$

□  
=  
∅ and  
{a<sub>j</sub>  
|  
j  
∈ T\*} is  
balanced,

kT

where  
T\* =  
.j =  
1 B j .  
This  
immediately  
proves  
Theorem  
5.2,  
when  
we  
take  
F(T)  
=  
C in  
case  
|T| > 1.

15
